Excerpt: . . . algorithm on the area outside the scan plane. Since the fields outside the scan plane axe not known, the error is estimated as the a priori knowledge of the energy not received by the scan plane. This criterion is frequently used to require retaining 80 to 85 of the radiated energy within the scan surface and limit test targets to ones that radiate directly. In this work, the array size and spatial windowing designs will be cho-sen to mimic the behavior of a compact range reflector. The array size requirement is thus the same as for a compact range reflector: the plane wave region must cover the test target entirely. For identicM target ( quiet ) zones, the necessary scan plane size is expected to be comparable with a compact reflector surface ( including rolled edges ). The size of the plane wave region...
